Key Concepts in the Analysis of Transport Phenomena

Heat Transfer

This involves the exchange of thermal energy between different bodies or regions at varying temperatures The mechanisms include conduction convection and radiation

Conduction

Think of a metal spoon heating up when placed in a hot cup of coffee Heat flows directly through the material due to the transfer of kinetic energy between molecules

Convection

Hot air rising and cold air sinking in a room is an example of convection This involves the movement of fluids liquids or gases carrying heat along with them

Radiation

The sun warming the Earth demonstrates radiation Heat energy is transferred through electromagnetic waves without the need for a medium

Mass Transfer

This describes the movement of matter from one region to another driven by concentration gradients

Diffusion

The gradual spreading of perfume throughout a room is a simple example of diffusion where particles move from a region of high concentration to one of low concentration

Convection

Mass transfer can also occur through fluid flow analogous to heat transfer by convection

2 Momentum Transfer
