building on the author s previous book in the series complex analysis with applications to flows and fields crc press 2010 transcendental representations with applications to solids and fluids focuses on four infinite representations series expansions series of fractions for meromorphic functions infinite products for functions with infinitely many zeros and continued fractions as alternative representations this book also continues the application of complex functions to more classes of fields including incompressible rotational flows compressible irrotational flows unsteady flows rotating flows surface tension and capillarity deflection of membranes under load torsion of rods by torques plane elasticity and plane viscous flows the two books together offer a complete treatment of complex analysis showing how the elementary transcendental functions and other complex functions are applied to fluid and solid media and force fields mainly in two dimensions the mathematical developments appear in odd numbered chapters while the physical and engineering applications can be found in even numbered chapters the last chapter presents a set of detailed examples each chapter begins with an introduction and concludes with related topics written by one of the foremost authorities in aeronautical aerospace engineering this self contained book gives the necessary mathematical background and physical principles to build models for technological and scientific purposes it shows how to formulate problems justify the solutions and interpret the results

numerical programs often use parallel programming techniques such as openmp to compute the program s output values as efficient as possible in addition derivative values of these output values with respect to certain input values play a crucial role to achieve code that computes not only the output values simultaneously but also the derivative values this work introduces several source to source transformation rules these rules are based on a technique called algorithmic differentiation the main focus of this work lies on the important reverse mode of algorithmic differentiation the inherent data flow reversal of the reverse mode must be handled properly during the transformation the first part of the work examines the transformations in a very general

way since pragma based parallel regions occur in many different kinds such as openmp openacc and intel phi the second part describes the transformation rules of the most important openmp constructs
