complex hierarchic syntax is considered one of the hallmarks of human language the
highest level of syntactic complexity recursive embedded clauses has been singled out
by some for a special status as the apex of the uniquely human language faculty
evolutionary but somehow immune to adaptive selection this volume coming out of a
symposium held at rice university in march 2008 tackles syntactic complexity from
multiple developmental perspectives we take it for granted that grammar is an adaptive
instrument of communication assembled upon the pre existing platform of pre
linguistic cognition most of the papers in the volume deal with the two grand
developmental trends of human language diachrony the communal enterprise directly
responsible for fashioning synchronic morpho syntax and ontogeny the individual
endeavor directly responsible for the acquisition of competent grammatical
performance the genesis of syntactic complexity along these two developmental trends
is considered alongside with the cognition and neurology of grammar and of syntactic
complexity and the evolutionary relevance of diachrony ontogeny and pidginization is
argued on general bio evolutionary grounds lastly several of the contributions to the
volume suggest that recursive embedding is not in itself an adaptive target but rather
the by product of two distinct adaptive gambits the recruitment of conjoined clauses as
modal operators on other clauses and the subsequent condensation of paratactic into

syntactic structures
