evolutionary models e g genetic algorithms artificial life explored in other fields for the past two decades are now emerging as an important new tool in gis for a number of reasons first they are highly appropriate for modeling geographic phenomena secondly geographical problems are often spatially separate broken down into local or regional problems and evolutionary algorithms can exploit this structure finally the ability to store manipulate and visualize spatial data has increased to the point that space time attribute databases can be easily handled

experienced author and teacher mark allen weiss now brings his expertise to the cs2 course with algorithms data structures and problem solving with c which introduces both data structures and algorithm design from the viewpoint of abstract thinking and problem solving the author chooses c as the language of implementation but the emphasis of the book itself remains on uniformly accepted cs2 topics such as pointers data structures algorithm analysis and increasingly complex programming projects algorithms data structures and problem solving with c is the first cs2 textbook to clearly separate the interface and implementation of data structures the interface and running time of data structures are presented first and students have the opportunity to use the data structures in a host of practical examples before being introduced to the implementations this unique approach enhances the students ability to think abstractly
