Around 500,000 people in the UK have type 1 diabetes. About 10% of the total with diabetes it can develop at any age but often in previously very healthy children and young adults. This is the first book in many years that has been published in the UK to support people with type 1 diabetes in managing their condition. Drawing on his many years working at one of the leading diabetes centres in the UK, Dr David Cavan provides a practical guide to managing all aspects of the condition, including insulin pump therapy and the latest technology available. This cutting-edge book presents invaluable advice that will offer genuine hope to adults with type 1 diabetes and their families.

The number of children with type 1 diabetes is steadily increasing and while research continues to search for a cure, the expectation is that those afflicted should enjoy a long life and healthy lifestyle. Medical research has conclusively proved that looking after your own diabetes and keeping your blood glucose level down is the key to avoiding the pitfalls and long-term risks.

In the field of immunology, type 1 diabetes has become one of the major areas of investigation, with studies that span from characterization of key molecules to trials for the prevention of the disease. Type 1 diabetes: molecular, cellular, and clinical immunology communicates both the background and the most recent understanding of this disorder, which will almost certainly be central to elucidating the etiology of autoimmunity and, in particular, of organ-specific autoimmunity. The book covers immunogenetics, immunopathogenesis, epidemiology, disease prediction, and clinical application of current knowledge. Both scientists seeking to understand and prevent type 1 diabetes autoimmunity as well as physicians caring for families with type 1 diabetes will be interested in this book.

Type 1 diabetes (T1D) is a disease marked by persistent hyperglycemia due to an autoimmune destruction of the pancreatic β cells. T1D is associated with severe short- and long-term complications and places a heavy burden on the health of the subjects and the national healthcare budget. Following the diagnosis of T1D, there is a relative period of endogenous insulin production called the honeymoon period or the phase of partial clinical remission (PR), when clinical and biochemical interventions could alter the trajectory of T1D. Research indicates that disease-modifying therapies that prolong the PR phase of T1D by preserving β cell function may reduce the severity of the long-term complications of T1D. These interventions to preserve the β cells of the pancreas have, however, had limited protection with successful therapies showing 15–20% effect size in preserving β cell survival in the first year of the trials. While the impact of other agents has been limited by severe side effects, ongoing trials with newer agents, either as monotherapies or in combination, are aimed at building on the effectiveness of existing agents. Other studies in the field of disease modification seek to determine the scope and characteristics of PR by investigating parameters such as lifestyle, clinical, and demographic factors that impact the survival of β cells. This research topic is focused on disease-modifying approaches in the study of T1D. These approaches are not limited to the PR phase but span stages I–III of the disease. Thus, the scope includes approaches that

seek to i clarify the determinants of pr ii prolong pr by various mechanisms iii reduce the predisposing factors to long term complications of t1d such as significant augmentation of time in range of glycemia we invite manuscripts on original research full and mini reviews and systematic reviews on content related to a disease modifying approaches to reduce the complications of t1d b mechanistic studies of disease modifying interventions in t1d c clinical applications of disease modifying approaches to reduce the complications of t1d d hypothesis and new thinking on disease modifying approaches in t1d
