this classic is one of the cornerstones of modern algebraic geometry at the same time it is entirely self contained assuming no knowledge whatsoever of algebraic geometry and no knowledge of modern algebra beyond the simplest facts about abstract fields and their extensions and the bare rudiments of the theory of ideals

there are many textbooks available for a so called transition course from calculus to abstract mathematics i have taught this course several times and always find it problematic the foundations of mathematics stewart and tall is a horse of a different color the writing is excellent and there is actually some useful mathematics i definitely like this book the bulletin of mathematics books

the use of algebraic methods for studying analysts is an important theme in modern mathematics the most significant development in this field is microlocal analysis that is the local study of differential equations on cotangent bundles this treatise provides a thorough description of microlocal analysis starting from its foundations the book begins with the definition of a hyperfunction it then carefully develops the microfunction theory and its applications to differential equations and theoretical physics it also provides a description of microdifferential equations the microlocalization of linear differential equations finally the authors present the structure theorems for systems of microdifferential equations where the quantized contact transformations are used as a fundamental device the microfunction theory together with the quantized contact transformation theory constitutes a valuable new viewpoint in linear partial differential equations originally published in 1986 the princeton legacy library uses the latest print on demand technology to again make available previously out of print books from the distinguished backlist of princeton university press these editions

preserve the original texts of these important books while presenting them in durable paperback and hardcover editions the goal of the princeton legacy library is to vastly increase access to the rich scholarly heritage found in the thousands of books published by princeton university press since its founding in 1905

the subject of this book is the successive construction and development of the basic number systems of mathematics positive integers integers rational numbers real numbers and complex numbers this second edition expands upon the list of suggestions for further reading in appendix iii from the preface the present book basically takes for granted the non constructive set theoretical foundation of mathematics which is tacitly if not explicitly accepted by most working mathematicians but which i have since come to reject still whatever one s foundational views students must be trained in this approach in order to understand modern mathematics moreover most of the material of the present book can be modified so as to be acceptable under alternative constructive and semi constructive viewpoints as has been demonstrated in more advanced texts and research articles

the need for an axiomatic treatment of homology and cohomology theory has long been felt by topologists professors eilenberg and steenrod present here for the first time an axiomatization of the complete transition from topology to algebra originally published in 1952 the princeton legacy library uses the latest print on demand technology to again make available previously out of print books from the distinguished backlist of princeton university press these editions preserve the original texts of these important books while presenting them in durable paperback and hardcover editions the goal of the princeton legacy library is to vastly increase access to the rich scholarly heritage found in the thousands of books published by princeton university press since its founding in 1905
