with rapid income growth dairy production and consumption in china have increased significantly this emergence of the dairy sector will provide opportunities for farmers to participate in a high value potentially more lucrative enterprise the overall goal of this paper is to analyze the major determinants of farmers participation in dairy production our main question is whether or not the pace of the emergence of the dairy processing industry has affected the ability of farmers to participate in dairy production and whether or not it has limited the expansion of their herd size based on household village and processor surveys conducted in the greater beijing region our analysis shows that the location of dairy processing firms is one of the key factors that determines the participation of farmers in dairy production although other factors affect participation and herd size for example access to roads and the ability to get a job off the farm which affects the opportunity cost of household members access to dairy processors is shown to be the major factor that has encouraged the growth of dairy production over the past decade the results also show that poor less educated farmers with relatively less access to land are not excluded from the rapid expansion of the greater beijing dairy market

this comprehensive book integrates new technology and concepts that have been developed in recent years to manage dairy farms in a profitable manner the approach to the production of livestock and quality milk is multidisciplinary involving nutrition reproduction clinical medicine genetics pathology epidemiology human resource management and economics the book is structured by the production cycle of the dairy cow covering critical points in cow management written and edited by highly respected experts this book provides a thoroughly modern and up to date resource for all those involved in the dairy industry

this paper explores the spatial heterogeneity in dairy production in the highland production area around the capital of ethiopia addis ababa we look at how urban proximity defined as the travel time from the farm to the central market of addis ababa affects the production decisions of ethiopian dairy farmers we sampled 870 households from the major rural production zones around addis ababa where villages were stratified according to their distance to addis ababa using an instrumental variable approach we find evidence of strong spatial heterogeneity in dairy milk productivity in ethiopia with each additional hour of travel time the milk productivity per cow is reduced by almost 1 liter per day a reduction by 26 percent on average this spatial heterogeneity in milk

productivity reflects a pronounced spatial variation in dairy production decisions producing liquid milk or processed dairy products the application of modern inputs and marketing when trying to disentangle the mechanisms through which urban proximity affects dairy productivity we show that the effect of travel time mainly runs through farmers inclusion into modern value chains and more specifically through their access to commercial milk buyers this finding holds when we control for prices indicating that access to commercial value chains are an important determinant of dairy productivity however as only a limited number of farmers now have access to such value chains in these settings measures to make dairy value chains more inclusive to remote farmers can have important economic development benefits for them
