the 1 150 pages contain more information than any other comparable book it is not a glossary or dictionary or review because all concepts are explained not just defined or mentioned covers the latest developments usually missed in textbooks and monographs the broad range of modern genetics of cell and molecular biology biometry etc are included without glossing over the classical foundations the hundreds of simple and clear illustrations are very useful for classroom purposes because they can be drawn on the blackboard or projected on a screen without taking much time to make the crucial points the cross references among the entries tie the contents into an extremely useful comprehensive textbook the concise style leads the reader to the point without verbiage the etymology of the terms is explained the text is not intimidating and it is very easy to read because all the terms are explained within the book most of the biometrical procedures are presented by worked out examples in a plain form rarely or not found at all in other books it effectively reaches out to non geneticists without compromising high scientific standards usually the most essential features of a concept are presented at the beginning of the entry and the reader can go as far as she he feels needed about the logic the web and e mail addresses of databases and other sources of detailed information are very helpful a well selected list of about 1000 references published mainly in the last couple of years completes the volume the moderate price makes it a best buy and an excellent choice to own for students teachers scientists physicians lawyers and all educated persons who cannot afford an entire library yet wish to be well informed

this is the first experimental protocol book that covers the differentiation of bone marrow derived stem cells bmscs into specific cell types targeted at the undergraduate and graduate student level the 19 chapters deal with the differentiation methods using small molecules cytokines and polymeric scaffolds bmscs are pluripotent in that they not only act as myelo regenerative and supportive cells but can also differentiate into almost any kind of cells in our body in addition when implanted in vivo they could help repair

multiple tissues such as blood vessels heart liver and so on for the differentiation of bmscs many methods have been introduced to adjust their microenvironment chemical and physical cues including chemical induction methods using large or small molecules and pellet culture mechanical stimulation induction methods using cyclic mechano transduction or ultrasonication cytokine released method using scaffolds and so on
