this monograph presents the latest research developments of innovative building envelope systems these systems have the ability to allow building structures responsive to changes in outdoor conditions to ensure comfortable indoor environment at higher energy efficiency compared to conventional systems

this book provides readers with a timely snapshot of the potential offered by and challenges posed by signal processing methods in the field of machine diagnostics and condition monitoring it gathers contributions to

the first workshop on signal processing applied to rotating machinery diagnostics held in setif algeria on april 9 10 2017 and organized by the applied precision mechanics laboratory lmpa at the institute of precision mechanics university of setif algeria and the laboratory of mechanics modeling and manufacturing la2mp at the national school of engineers of sfax the respective chapters highlight research conducted by the two laboratories on the following main topics noise and vibration in machines condition monitoring in non stationary operations vibro acoustic diagnosis of machinery signal processing and pattern recognition methods monitoring and diagnostic systems and dynamic modeling and fault detection

the papers presented on this occasion examined the most significant aspects of diagnostic strategies emphasizing the importance of predictive maintenance in reducing production shortages and the costs of plant management the contributions of these authors allow a critical comparison of the varied experiences in developing and applying the different diagnostic methodologies employed in several parts of the world the following problems are discussed characteristics of condition monitoring systems data acquisition techniques and data processing methodologies choice of transducers and of measurement point locations data compression techniques alarm levels evaluation acceptance regions strategies for detecting malfunction conditions diagnostic methodologies for the on line and off line identification of the cause of fault expert systems definition of the guidelines for the presentation in control rooms of monitoring data and diagnostic results rotordynamic models used off line to confirm faults diagnosed on line

vibration analysis has found widespread application for condition monitoring in a variety of applications and industries with the continual development of cheaper and more powerful processing hardware such systems have developed from utilizing simple checks on amplitude to those based around sophisticated spectral analysis this book presents application of the model based diagnostic method for early detection of faults in rotating machinery the proposed diagnostics system based on two methods modal analysis oma and omax methods and non linear signals models narx in the book the diagnostic system based on such modeling is presented the proposed system was verified during research on a specialized test rig which can generate vibration signals and on data recorded at wind turbine in the book practical aspects of the developed diagnostics system application are also discussed i e sensitivity of the method complexity of the algorithm and effort needed to apply the method on a real machine

vibratory condition monitoring of machines discusses the basic principles applicable in understanding the vibratory phenomena of rotating and reciprocating machines it also addresses the defects that influence vibratory phenomenon instruments and analysis procedures for maintenance vibration related standards and the expert systems that help ensure good maintenance programs the author offers a minimal treatment of the mathematical aspects of the subject focusing instead on imparting a physical understanding to help practicing engineers develop maintenance programs and operate machines efficiently

as the most important parts of rotating machinery rotors are also the most prone to mechanical vibrations which may lead to machine failure correction is only possible when proper and accurate diagnosis is obtained through understanding of rotor operation and all of the potential malfunctions that may occur mathematical modeling in particular
