highly useful reference for academic researchers and industry practitioners alike

in a context of global competition the optimization of logistics systems is inescapable logistics systems design and optimization falls within this perspective and presents twelve chapters that well illustrate the variety and the complexity of logistics activities each chapter is written by recognized researchers who have been commissioned to survey a specific topic or emerging area of logistics the first chapter by rupert langevin and campbell develops a framework for the entire book it classifies logistics decisions and highlights the relevant linkages to logistics decisions the intricacy of these linkages demonstrates how thoroughly the decisions are interrelated and underscores the complexity of managing logistics activities each of the chapters focus on quantitative methods for the design and optimization of logistics systems

logistics systems analysis logistics the subject of this monograph is narrowly defined here to be the science that studies how to convey items from production to consumption in cost effective ways some subjects of interest to logistics managers such as reliability and maintenance are not addressed the theories that are covered on the other hand apply to generic items that can represent people as well as freight they should be of interest to passenger transportation firms and agencies besides transportation a logistics system usually includes other activities such as inventory control handling and sorting which must be carefully coordinated if cost effectiveness is to be achieved yet both in theory and practice these activities are often examined separately the operations research field includes sub fields with specialized journals in inventory control transportation warehousing etc over the years these sub fields have evolved into disciplines that have developed their own specialized conventions and jargon as a result making it increasingly difficult for researchers to communicate across disciplinary boundaries something similar happens in practice when firms become compartmentalized if responsibilities for different logistical activities are allocated to different managers decisions in the best interests of the firm are difficult if not impossible to make

this textbook introduces logistics from a broad perspective to include all activities throughout the product and service life cycle pertaining to supply chain and logistics management the physical supply and distribution of products and the corresponding maintenance and support it recognizes the mutual interdependence of the major functional areas of the organization including marketing production and finance the emphasis throughout the text is on logistics in the context of a total business system design process it views the business as a system managing logistics within that system and thus transforming their supply chain pedagogy to aid learning is incorporated throughout every chapter with chapter objectives case studies and concept checks this text is intended for both upper level undergraduate and lower level graduate students in both business and engineering on logistics and supply chain tracks it can also serve as a reference for practitioners actively engaged in day to day management of logistics and supply chain activities supplementary online resources include an instructors manual chapter by chapter powerpoint slides glossary and a test bank of exam questions

this book examines logistics systems in an integrated way its goal is to describe and show how to find rational structures for logistics

systems considering all the relevant aspects building on an understanding of the simplest logistical system with only one origin and one destination the book treats problems with many origins and one destination many destinations and one origin and many origins and many destinations this is done for systems with and without transshipments the solutions and methodologies presented in the book are particularly helpful in instances where detailed data are not available and when time is of the essence

lean management describes a set of methods combined with a management philosophy which aims at eliminating waste in logistics processes in production logistics lean is already widespread and applied successfully research has shown that lean also works in a warehousing environment in transport logistics lean is still at a low level of maturity in both research and practice this work contributes to closing this gap by introducing heijunka leveling to transport logistics

this report identifies constraints addresses issues and suggests possible solutions and approaches that could facilitate the development of policies to promote efficient and sustainable international transport logistics

in a context of global competition the optimization of logistics systems is inescapable logistics systems design and optimization falls within this perspective and presents twelve chapters that well illustrate the variety and the complexity of logistics activities each chapter is written by recognized researchers who have been commissioned to survey a specific topic or emerging area of logistics the first chapter by riopel langevin and campbell develops a framework for the entire book it classifies logistics decisions and highlights the relevant linkages to logistics decisions the intricacy of these linkages demonstrates how thoroughly the decisions are interrelated and underscores the complexity of managing logistics activities each of the chapters focus on quantitative methods for the design and optimization of logistics systems
