previous studies showed that both healthy and pathological aging are associated with changes in brain structure and function of the mature human brain the most prominent anatomical alteration are changes in prefrontal cortex morphology volume loss and reduced white matter integrity and hippocampal atrophy cognitive decline affects mainly the performance of episodic memory speed of sensory information processing working memory inhibitory function and long term memory it has been also proposed that due to the aforementioned changes the aging brain engages in compensatory brain mechanism such as a broader activation of cortical regions mainly frontal rather than specialized activation evidence suggests that similar changes occur with pathological aging but to a greater extent in this case information flow is disrupted due to neurodegeneration functional activation of posterior occipito temporal regions is decreased and as a consequence the brain fails to process sensorial input in the ventral pathway and cognitive deficits appear in the last years functional alterations associated with aging have been studied using the mathematical notion of graph theory that offers an integrative approach since it examines different properties of the brain network 1 organization level 2 amount of local information processing 3 information flow 4 cortical community structure and 5 identification of functional anatomical hubs so graph theory offers an attractive way to model brain networks organization and to quantify their pathological deviations previous studies have already employed this mathematical notion and demonstrated that age related neurodegeneration is often accompanied by loss of optimal network organization either due to diminished local information processing or due to progressive isolation of distant brain regions they have also found that changes in network properties may be present even in the preclinical phase which could be taken as a biological marker of disease

the papers in this volume of consciousness emotion book series are organized around the theme of enaction enactive emotional processes are not merely the recipients of information or the passive victims of input and learning the organism first is engaged in an ongoing complex pattern of self organizational activity for the purpose of maintaining a dynamical continuity of pattern across changes of subserving micro constituents and environmental conditions making use of multiple shunt mechanisms feedback loops and other complex dynamical features self organizational structure is used to distinguish between action and mere reaction accordingly the papers of this volume by leading students of emotion such as jaak panksepp luc ciompi thomas natsoulas farzaneh pahlavan michela balconi todd lubart louise sundararajan jordan petersen and others address three main issues i emotional influences on perception and thought ii agency and choice iii agency and moral value
