a comprehensive mathematical and computational modeling of co2 geosequestration and compressed air energy storageenergy and environment are two interrelated issues of great concern to modern civilization as the world population will soon reach eight billion the demand for energy will dramatically increase intensifying the use of fossil fuels ut

this text details papers presented at a conference for all those involved in the application development and research of multiphase technology topics covered include field measurements separation boosting and metering and modelling

the production of carbon dioxide from the oxidation of fossil carbon over the past 200 years has resulted in the accumulation of  $\text{CO}_2$  in the atmosphere  $\text{CO}_2$  like other greenhouse gases slows the rate at which infrared radiation is emitted from the earth by increasing the concentration of  $\text{CO}_2$  in the atmosphere humanity is altering the earth's radiation balance in potentially dangerous way mitigating humanity's impact on earth's climate system requires transforming the global energy infrastructure to decrease anthropogenic emissions of  $\text{CO}_2$  the body of work presented here covers a range of physical and chemical topics important for the mitigation of anthropogenic climate change through the capture and storage of carbon dioxide this book is focused primarily on addressing  $\text{CO}_2$  emissions from large stationary point sources through  $\text{CO}_2$  capture and storage a portion of the work however is aimed at addressing the long tail of the  $\text{CO}_2$  point sources distribution by removing  $\text{CO}_2$  directly from the atmosphere the entire CCS supply chain from the thermodynamic limit of the work required the capture of  $\text{CO}_2$  from power plants to the long term chemical and physical evolution of carbon dioxide
