this thesis focuses on the medium access control mac layer many mac protocols for wireless networks proposed or implemented to date are based on collision avoidance handshakes between sender and receiver the key objective of collision avoidance handshakes is reducing or eliminating the collision of data packets from a source at any given receiver due to interference from packets from other sources in the vast majority of these protocols including

the ieee 802 11 standard the handshake is sender initiated in that the sender asks the receiver for permission to transmit using a short control packet and transmits only after the receiver sends a short clear to send notification there are two main objectives in this work analyze the effect of reversing the collision avoidance handshake as a way to improve the performance of mac protocols under any conditions in the network and design mac protocols that provide correct floor acquisition without carrier sensing or code pre assignment we show that receiver initiated collision avoidance mac protocols not only outperform any sender initiated ones but also guarantee collision free data transmission and seamless support for mobility by using simple low cost wireless radios we study the effect of persistent carrier sensing in receiver as well as sender initiated mac protocols we extend our work to multi channel radios and introduce novel collision avoidance mac protocols that eliminate the need for carrier sensing and code pre assignment and improve the utilization of the medium in the presence of unicast multicast and broadcast traffic
