international tables for crystallography are no longer available for purchase from springer for further information please contact wiley inc follow the link on the right hand side of this page the purpose of volume c is to provide the mathematical physical and chemical information needed for experimental studies in structural crystallography the volume covers all aspects of experimental techniques using all three principal radiation types from the selection and mounting of crystals and production of radiation through data collection and analysis to interpretation of results as such it is an essential source of information for all workers using crystallographic techniques in physics chemistry metallurgy earth sciences and molecular biology

the conference promotes the theoretical and methodological development of crystallographic investigations of aperiodic crystals including modulated structures polytypes incommensurate misfit or composite crystals and quasi crystals it also promotes scientific interchange among groups working in the various fields of aperiodic materials special emphasis will be given to multidisciplinary aspects of aperiodicity

one of the fundamental objectives of physical geochemistry is to understand the evolution of geochemical systems from microscopic to regional and global scales at present

there seems to be a general recognition of the fact that internal properties of minerals record important aspects of the evolutionary history of their host rocks which may be unraveled by very fine scale observations a major focus in the development of geochemical research in the last thirty years has been the application of classical thermodynamics to reconstruct the conditions at which the states of quenched mineralogical properties of rocks have equilibrated during the course of their evolution while these works have fundamentally influenced our understanding of the physico chemical history of rocks in recent years petrologists mineralogists and geochemists have been making greater efforts towards the application of kinetic theories in order to develop a better appreciation of the temporal details of geochemical processes the present volume brings together a variety of current research on transport in systems of geochemical interest from atomic to outcrop scales a major theme is atomic migration or diffusion and its various manifestations on microscopic and macroscopic scales transport in the solid state is controlled by diffusion and is responsible for the states of atomic ordering and relaxation of compositional zoning in minerals development of compositional zoning during cooling exsolution lamellae and creep
