michael tooley presents a major new philosophical study of time and its relation to causation the nature of time has always been one of the most fascinating and

perplexing problems of philosophy it has in recent years become the focus of vigorous debate between advocates of rival theories the traditional tensed accounts of time which hold that time has a direction and that the flow of time is part of the nature of the universe have been challenged by tenseless accounts of time according to which past present and future are merely subjective features of experience rather than objective features of events time tense and causation offers a new approach in many ways intermediate between these two rivals tooley shares with tensed approaches the views that the universe is dynamic and that the past and present are real while the future is not but he rejects the view that this points to the existence of irreducible tensed facts tooley's approach accounts for time in terms of its relation to causation he argues that the direction of time is based upon the direction of causation and that the key to understanding the dynamic nature of the universe is to understand the nature of causation he analyses tensed concepts and discusses semantic issues about truth and time finally addressing the formidable difficulties posed for tensed accounts of time by the special theory of relativity he suggests that a modified version of the theory compatible with the account of time in this book is to be preferred to the standard version time tense and causation is rich in sophisticated and stimulating discussions of many of the deepest problems of metaphysics it will be essential reading for anyone specialising in this area of philosophy

originally published in 2000 this is the first volume of a comprehensive two volume treatment of quadratic optimal control theory for partial differential equations over a finite or infinite time horizon and related differential integral and algebraic riccati equations both continuous theory and numerical approximation theory are included the authors use an abstract space operator theoretic approach which is based on semigroups methods and which is unifying across a few basic classes of evolution the various abstract frameworks are motivated by and ultimately directed to partial differential equations with boundary point control volume 1 includes the abstract parabolic theory for the finite and infinite cases and corresponding pde illustrations as well as various abstract hyperbolic settings in the finite case it presents numerous fascinating results these volumes will appeal to graduate students and researchers in pure and applied mathematics and theoretical engineering with an interest in optimal control problems
